

SECTION 6. ADJUSTMENT PROCEDURES

Adjustment Procedure

1. Power supply PCB

1. Power Supply and High Voltage Parts

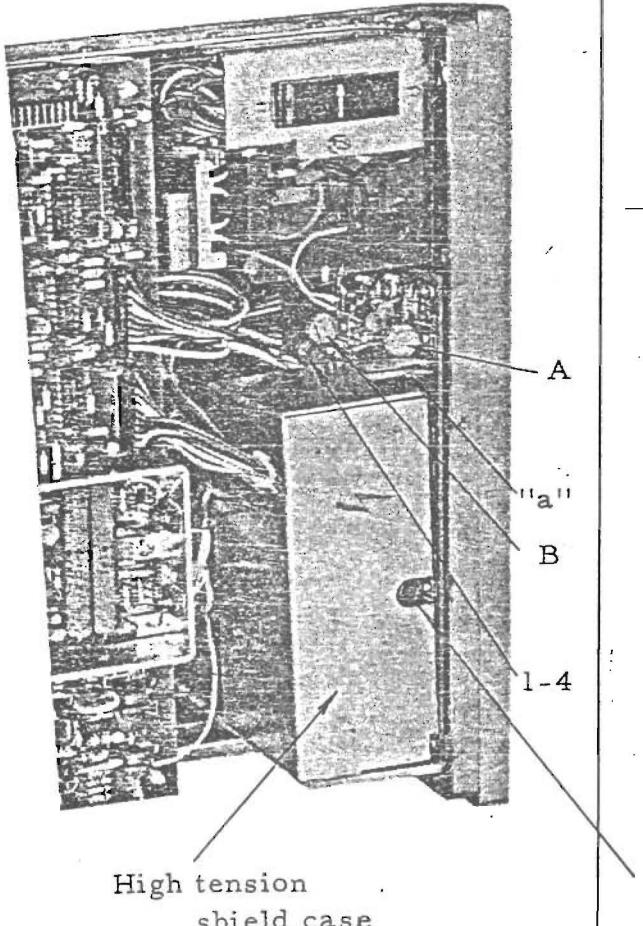

1-1 Low voltage part

Confirm a ripple of 5mV_{p-p} and 50mV_{p-p}, or less for a power supply of ±12V, +5V and +100V, +120V, respectively, using digital voltmeter.

Voltage	Regulation	Ripple
+12V	+11.5~+12.5V	5mV _{p-p} , or less
+5V	+4.8 ~ +5.2V	5mV _{p-p} , or less
-12V	-11.5 ~ -12.5V	5mV _{p-p} , or less
+100V	+95 ~ +105V	50mV _{p-p} , or less
+120V	+110 ~ +130V	50mV _{p-p} , or less

1-2 High voltage part

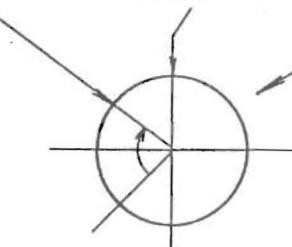

Adjust this control for a CRT pin 14 voltage of -1.5kV.

Adjustment Procedure

First trace-
appearing

position Center

INTENSITY
control

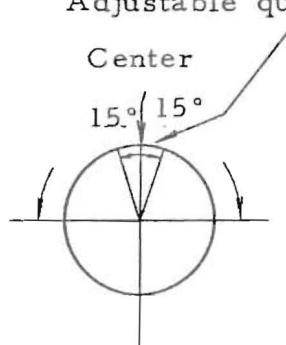

Use an oscilloscope to measure
the Z-axis output at "a" point,
with the INTENSITY control set
fully counter clockwise, and
adjust the control B till the out-
put voltage shows the following
pattern:

Adjustable quadrants

Center

15° 15°

1-3

CRT BIAS

Set the INTENSITY control
to 90° from the minimum
position and adjust control A
so that the trace begins to
appear just there.

1-4

ASTIGMATISM

Apply a 1 kHz sinewave so
that the display covers the
entire graticule area.

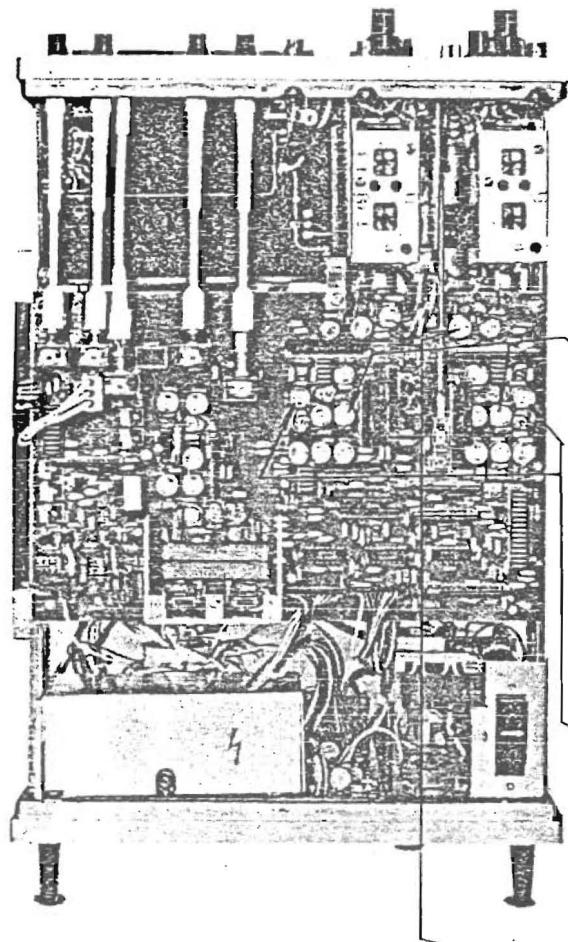

Adjust this control and the
front panel FOCUS control
together for a well-defined
trace.

1-5

Confirming FOCUS control setting

Ensure the dot (.) on the
FOCUS control matches the
midposition of trace clear-
ness (see figure) with $\pm 15^\circ$
tolerance.

Adjustment Procedure

- 1-6 Confirming high-voltage oscillator start

Confirm the oscillator for high-tension circuit starts the moment the POWER switch is turned on.

2. Vertical Deflection System

- 2-1 20mV/DIV ($\times 1$)

Apply a signal of $0.1\text{V}_{\text{p-p}}$ and adjust both CH1 and CH2 gain controls for exact 5-division display.

- 2-2 2mV/DIV ($\times 10$)

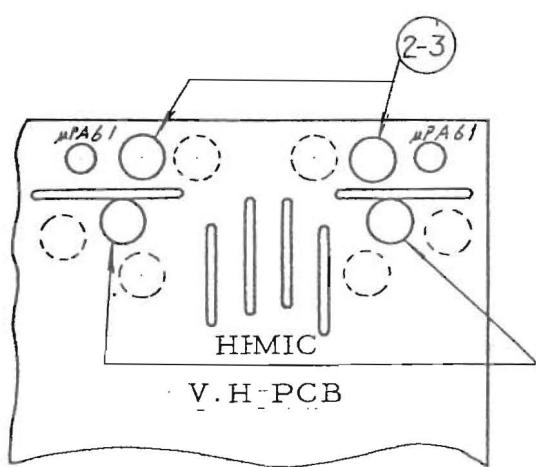

Same as above, but with an input signal of $0.01\text{V}_{\text{p-p}}$

- 2-3 Magnifier ($\times 1$, $\times 10$) balance

Set the VARIABLE control (both CH1 and CH2) to CAL position and get a trace at center with the magnifier set to $\times 1$ position.

Change the magnifier setting to $\times 10$ and confirm the trace does not move vertically.

Adjustment Procedure

2-4 VARIABLE control balance

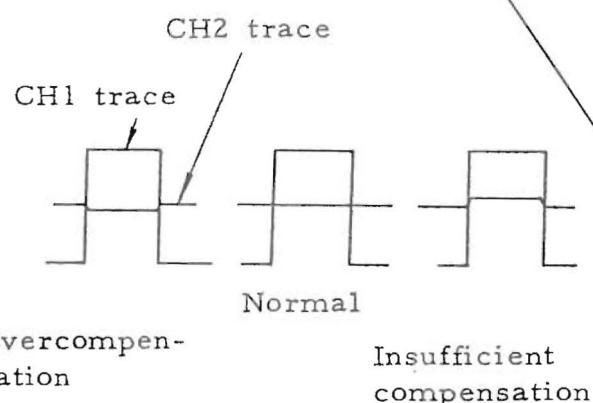

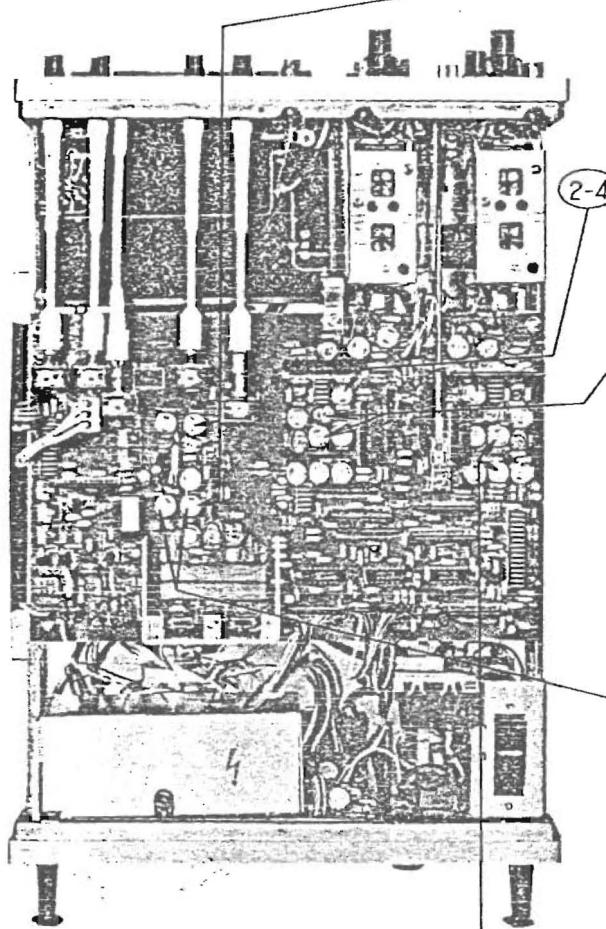

Get a trace at center with the VARIABLE control set to CAL position. Turn the control setting to UNCAL (fully CCW); this may cause the trace to move somewhere. If so, adjust this control (CH1, CH2) to bring the trace to its original central position.

Repeat this procedure so that the VARIABLE control causes no vertical movement of trace in CAL and UNCAL positions.

2-5 Square wave and frequency response-I (x1)

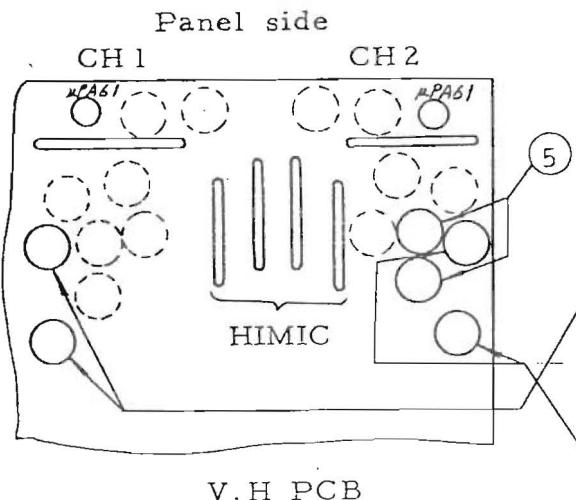

- ① Set CH1 VOLTS/DIV switch at 20mV/DIV. Apply a 1 kHz square wave to CH1 input connector and adjust this control for flat top.

Adjustment Procedure

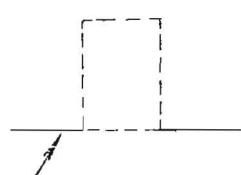

- ② In condition ① above, change the input signal to 100 kHz square wave, and adjust this control for flat top.
- ③ Adjust these controls for flat square wave while confirming the frequency response meets the requirement. (The control in step ② may be adjusted along with it.)
- ④ Confirming CHOP crosstalk
Set the V MODE switch to CHOP and CH1 VOLTS/DIV switch at 20mV/DIV. Apply a 1 kHz square wave and ensure the CH2 trace is a straight line. Should interference exist, repeat the above steps ② and ③
- ⑤ Set CH2 VOLTS/DIV switch at 20mV/DIV and adjust these controls on CH2 for flat 100 kHz square wave, with the required

Adjustment Procedure

V.H PCB

Apply and disconnect 1 kHz square wave alternately.

frequency response.

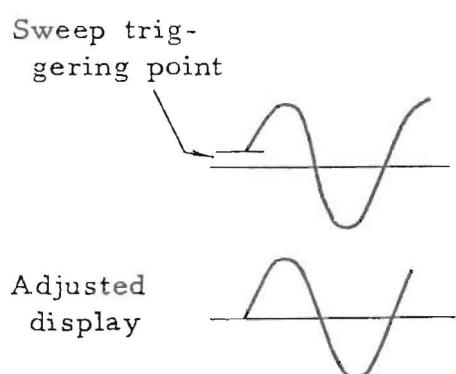

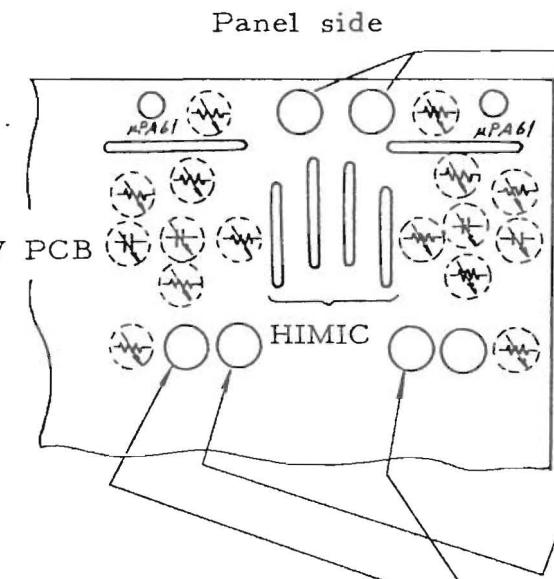

- . Square wave and frequency response-II (x10)

6 Set CH1 VOLTS/DIV switch at 2mV/DIV and adjust these controls on CH1 for flat 100 kHz square wave, with the required frequency response.

7 Repeat the above step with CH2 VOLTS/DIV switch set at 2mV/DIV.

8 DC shift (both CH1 and CH2)
Apply a 1 kHz square wave of 5-division amplitude to either channel at 2mV/DIV (x10) and 20mV/DIV (x1) setting respectively. Change the input coupling switch AC-GND-DC between GND and DC, and ensure the baseline trace does not move.

Adjustment Procedure

- 2-6 POSITION CENT (both CH1 and CH2)
Set the POSITION control to mid-range and adjust these controls to get a trace at center.
- 2-7 TRIG DC LEVEL
(1) Apply a 50 kHz sine wave to CH1 input connector and set TRIG to CH1, AC. Adjust this control so the sweep starts from the center of the signal when the trigger coupling switch is positioned to DC and ensure the sweep starts at the same point.
- (2) Apply the signal to CH2 and proceed to adjustment in the same way as (1), setting TRIG to CH2.
- (3) In condition (2) above, switch the TRIG to NORM and adjust this control so the sweep starts from the center of the signal

Adjustment Procedure

(In this case, POSITION control setting affects the triggering point.)

2-8 Confirming CH2 polarity inversion

Normal 

Invert 

Apply a 1 msec time marker (positive in polarity) to CH2 input connector and change the polarity switch to negative.

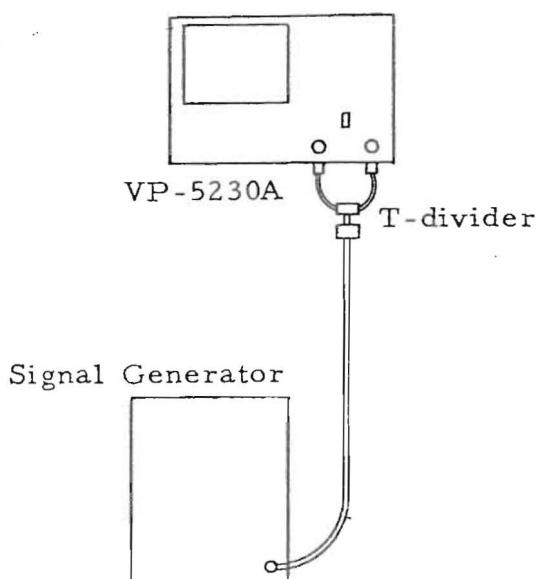

Ensure the display changes as shown.

2-9 Confirming ADD function

① Common mode rejection of 50 kHz

Apply a 50 kHz sine wave to CH1 and CH2 simultaneously using a T-divider. (Get a 4-division display for each channel.)

Display on CH2 should be as follows:

<u>Polarity</u>	<u>Amplitude</u>
NORM	8 divisions
INV	0 divisions

Adjustment Procedure

(2) Common mode rejection of 10 MHz

In condition (1) above, change

the input signal frequency to

10 MHz. [Display should be less than 0.4 division.]

2-10 CH3 POSITION

Depress DUAL and TRIPLE buttons of the V MODE switch at the same time and adjust the control so the CH3 trace appears in the two divisions from the bottom of graticule.

2-11 Confirming alternate trigger

Set the TRIG switch to NORM,

apply a 1 kHz sine wave to

CH1 and a 1 kHz square wave to

CH2, and make sure you get

stable display.

2-12 Confirming linearity

Get a two-division trace at center,

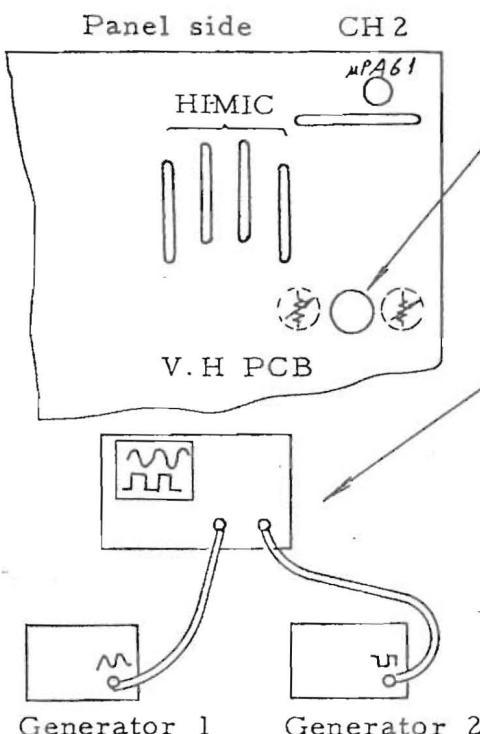

and move it with the POSITION

control over entire graticule, and

ensure that the trace amplitude

variation meets the requirements.

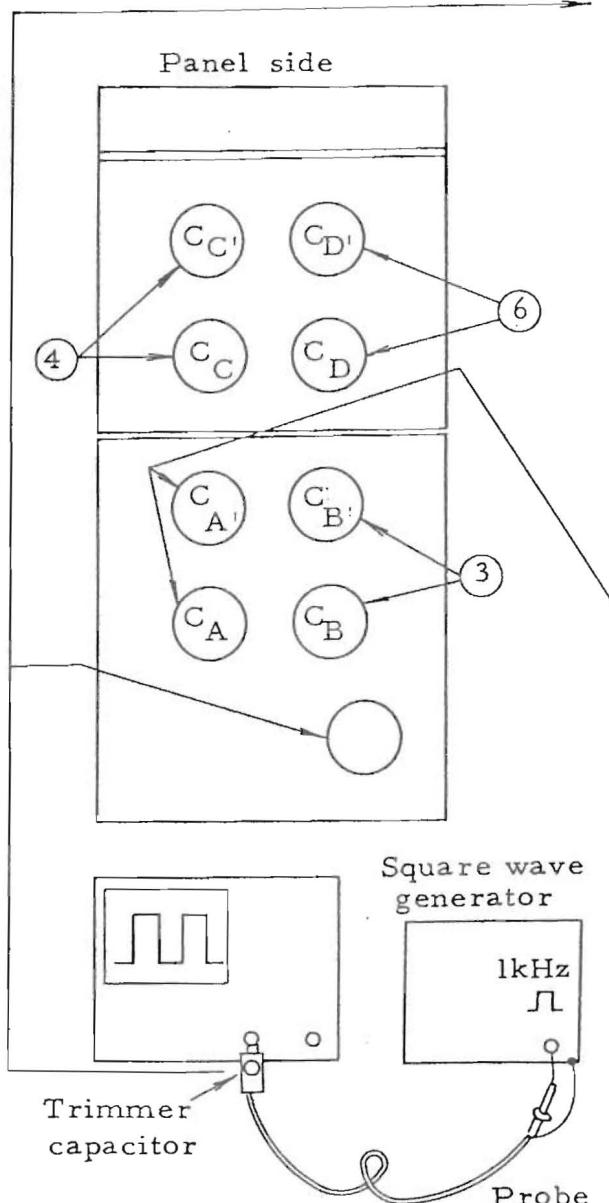

(2 ± 0.2 Div at 30 MHz)

No time relationship exists between generators 1 and 2.

Adjustment Procedure

	CH1	CH2
ATT interference	2mV/DIV, GND	1V/DIV 5V $p-p$ 50kHz INPUT Signal
	1V/DIV, 5V $p-p$ 50kHz INPUT Signal	2mV/DIV GND
Amplifier interference	2mV/DIV, GND	2mV/DIV 10mV $p-p$ 10kHz INPUT Signal
	2mV/DIV 10mV $p-p$ 10kHz INPUT Signal	2mV/DIV GND

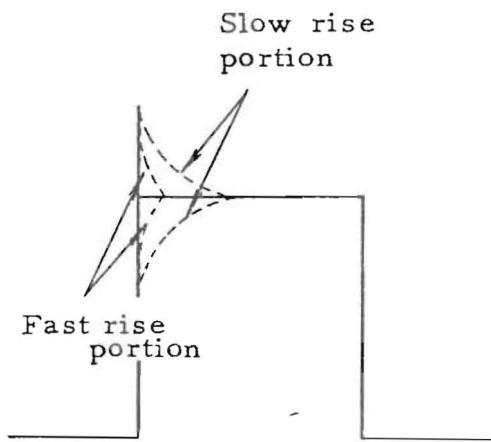

2-13 Confirming interference
Make connections as in 2-9, apply sine wave signals and set controls as in this table. Ensure ATT and amplifier interferences are within 0.2 division.

3. Attenuator

- 3-1 Input capacitance (both CH1 and CH2)
Set the VOLTS/DIV switch to 20mV/DIV and adjust this trimmer capacitor to 30pF. Connect the probe and adjust its trimmer capacitor for flat 1-kHz square wave applied.
- 3-2 50mV/DIV setting (both CH1 and CH2)
Apply a 1 kHz square wave, 6 divisions in amplitude and adjust C_A and $C_{A'}$ for fast and slow rise portions respectively.

Adjustment Procedure

3-3 0.1 V/DIV setting (both CH1 and CH2)

Same as above, but adjust C_B and C_B' for fast and slow rise portions respectively.

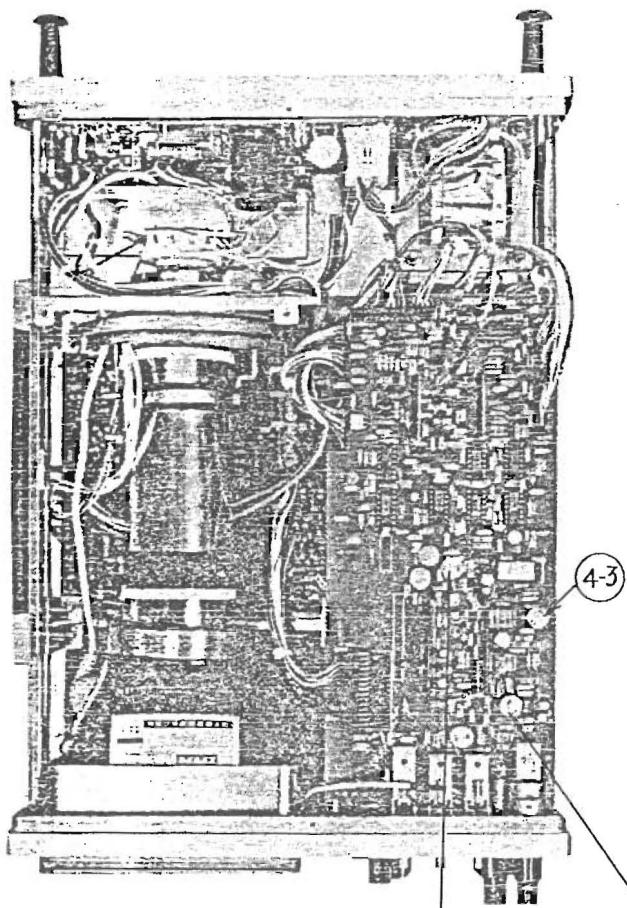

3-4 0.2 V/DIV setting (both CH1 and CH2)

Adjust C_c and C_c' in the same way (cf. 3.2) for fast and slow rise portions respectively.

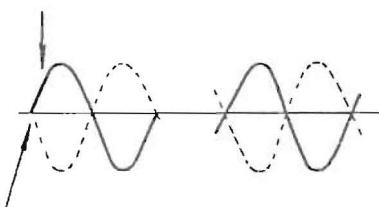

3-5 0.5V/DIV and 1V/DIV setting (both CH1 and CH2)

These settings hardly require any specific adjustment; however, if the trace shows acute overshoot or rounding, adjust C_A' and C_B' ensuring that 50mV/DIV and 0.1V/DIV setting adjustments meet the requirements.

Adjustment Procedure

Trigger start point

Adjusted waveform

- 3-6 2V/DIV setting (both CH1 and CH2)

Adjust C_D and C_D' in the same way (cf. 3.2) for fast and slow reise portions, respectively.

- 3-7 5V/DIV and 10V/DIV settings (both CH1 and CH2)

Confirm that there are not overshoot or-rounding when a 1 kHz square wave is applied.

4. Trigger setting

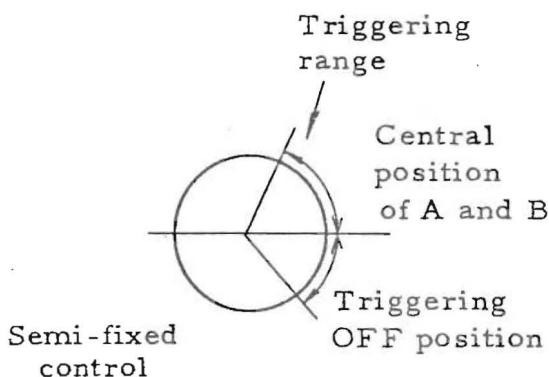

4-1 Trigger level center

Set the front-panel TRIG level to mid-range and adjust this control so the sweep is triggered at the center of the positive-going portion.

4-2 SLOPE +, -

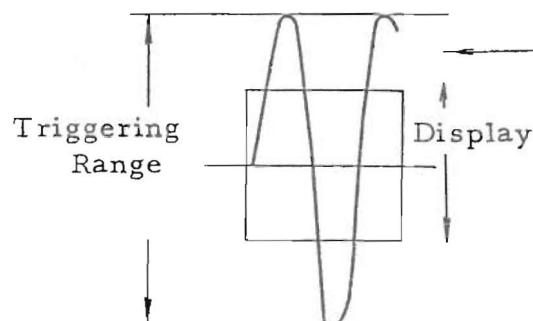

Turn the SLOPE switch to + and - positions, and adjust this control so the sweep is

Adjustment Procedure

triggered by different points
on positive and negative-going
portions.

- 4-3 FIX trigger sensitivity
Apply a 50 kHz sine wave
for a 0.4-division display.
Turn the FIX trigger control
gradually to the right to find
a point where trace is trig-
gered. Turn it further to
find some other point where
trace is not triggered, and
then finally set the FIX
control to the middle of these
two points.

- 4-4 Trigger level selection
Apply a 50 kHz sine wave, and
turn the TRIG LEVEL control fully
to the left and then to the right
to ensure a 20-division display.

Adjustment Procedure

4-5 TV triggering

Set the AC-DC-TV switch to TV position and the SLOPE switch to position. Ensure that the trace is triggered by internal or external signal, or TV vertical and horizontal synchronizing signals, when setting the TIME/DIV switch as shown left. These trigger signals should meet the specified requirements.

4-6 LINE triggering

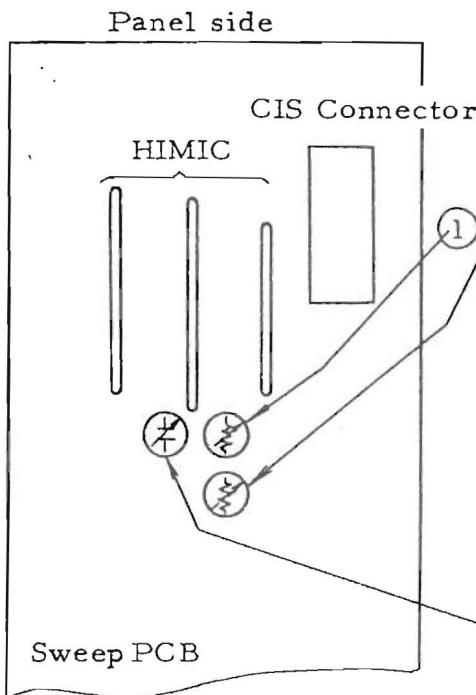

Ensure that line frequency display of 8 divisions can be selected as a trigger signal.

4-7 X-Y adjustments

① Deflection factor

Set the VOLTS/DIV switch at 20mV/DIV (x1) and adjust this control so that the 0.1V input produces an exact 5-division display.

Adjustment Procedure

② POSITION setting

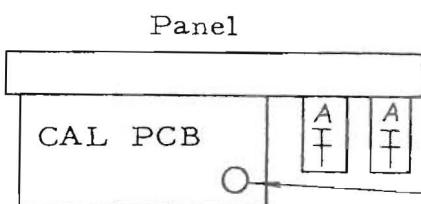

Adjust the POSITION control so that the A-sweep (1 msec/DIV) starts at the extreme left of the graticule.

Set the MODE switch to X-Y and adjust the X-Y POSITION control without disturbing H POSITION to bring the spot to the center.

③ Phase setting

Apply the 50 kHz sine wave of 4-division amplitude to both CH1 and CH2 connectors through T-divider. Change the frequency to 1 MHz and adjust this capacitor so the trace is a straight line.

4-8 External triggering
Set the V MODE to DUAL and TRIPLE, and apply a 1 kHz square wave to the CH1 input connector. Adjust this

Adjustment Procedure

capacitor for a flat-top

CH3 display.

4-9 Confirming AUTO SWEEP

Apply a 100 Hz sinewave to the EXT TRIG input connector, ensuring that trace is triggered and that sweep free runs when no signals are applied.

4-10 Trigger sensitivity

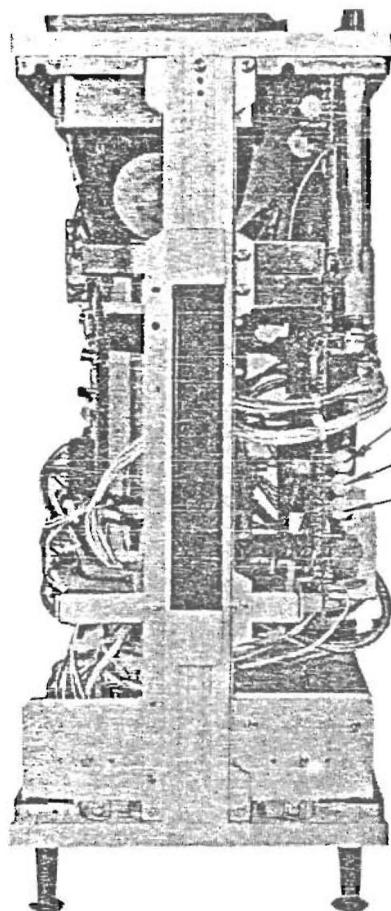

Ensure the trace is triggered by the trigger signal having the specified frequency amplitude, and voltage.

5. Horizontal Deflection System

5-1 NORM GAIN

Set the A TIME switch at 1 msec/DIV and connect 1 msec time marker signals. Adjust this control so that the time marker signals line up at intervals of 1 division.

Adjustment Procedure

5-2

MAG GAIN

Keep the A TIME switch set at 1 msec/DIV and connect 0.1 msec time marker signals.

Adjust this control so that the time marker signals line up at intervals of 1 division.

5-3

MAG REGI

Set the A TIME switch at 1 msec/DIV and connect 5 msec time marker signals. Position the second time marker to the center vertical graticule line. Adjust this control so that the second time marker still remains the same position when Horizontal gain is set to x10.

5-4

10 msec/DIV setting (A sweep)
Adjust this control so that the 10 msec time marker signals line up at intervals of 1 division.

Adjustment Procedure

5-5 10 μ sec/DIV setting (A sweep)

Adjust this control so that the
10 μ sec time marker signals
line up at intervals of 1
division.

5-6 0.1 msec/DIV setting (B sweep)

Adjust this control so that the
0.1 msec time marker signals
line up at intervals of 1
division.

5-7 10 μ sec/DIV setting (B sweep)

Adjust this control so that
the 10 μ sec time marker
signals line up at intervals
of 1 division.

5-8 DELAY start/stop

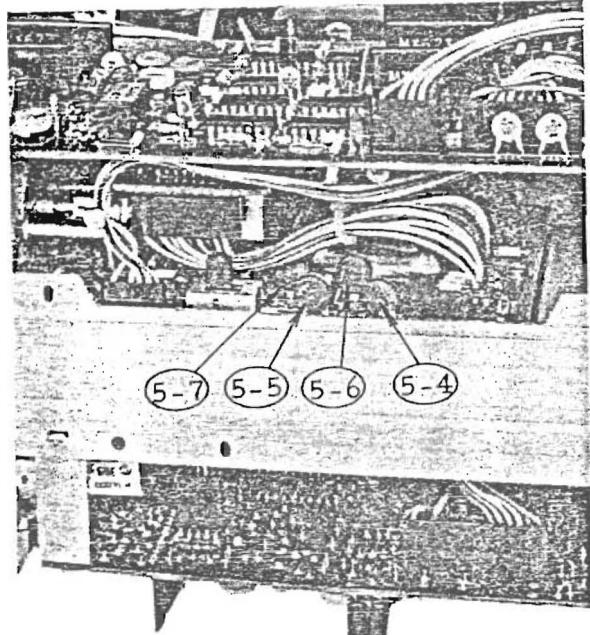

① Set the controls as follows:

A, A INT, B A INTEN

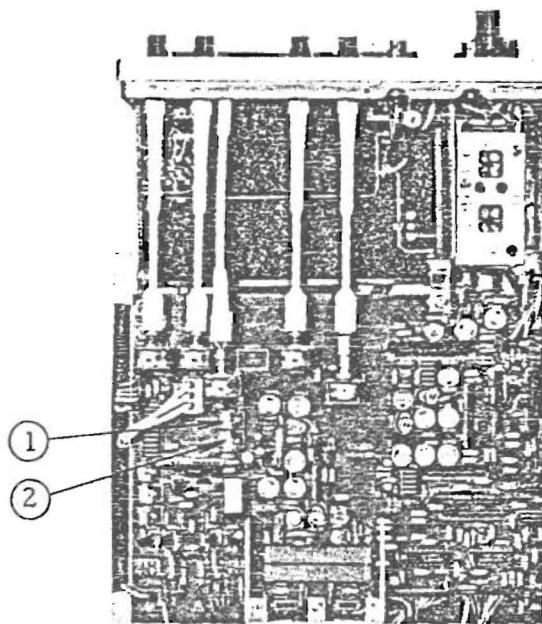

A Sweep time 0.5 msec /DIV

B Sweep time 0.5 μ sec/DIV

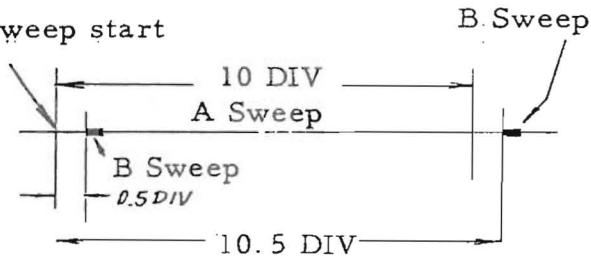

Turn the DELAY TIME POSITION
control fully counterclockwise

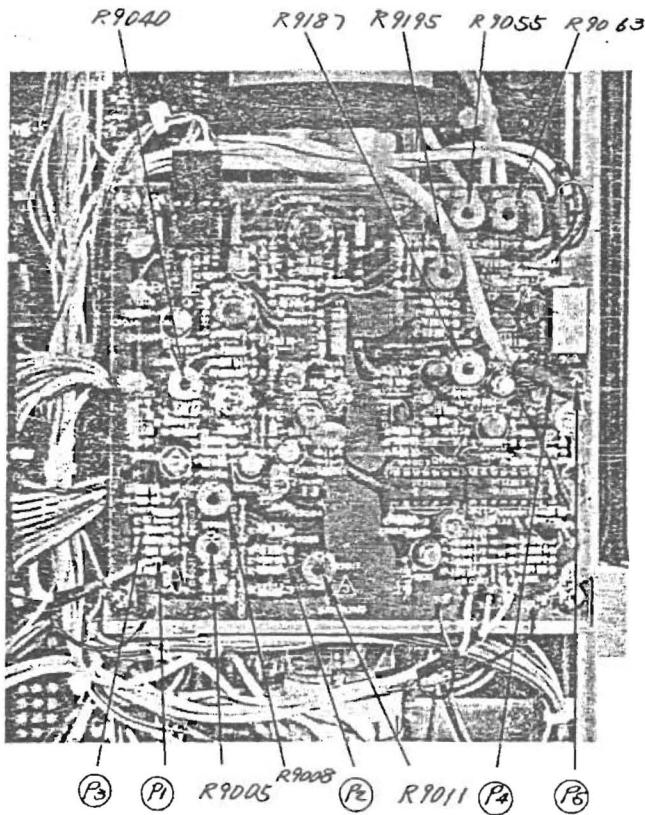

Adjustment Procedure

A Sweep start

B Sweep

and adjust this control so the

B sweep starts from 0.5 division point.

- ② Turn the DELAY TIME POSITION control fully clockwise and adjust this control so the B sweep starts from 10.5 division point
- Repeat the above settings ①, and ② for more fine adjustment.

6. Record Out (option)

6-1 Input DC level

Set the V mode switch to CH1 or CH2 and position the trace to the center horizontal graticule line when the input coupling is set to GND. Adjust R9011 so that the voltage of test point P₁ becomes OV.

Adjustment Procedure

6-2 Diode bias

(1) Adjust R9005 so that the voltage across P_2 and P_3 becomes exactly 2V.

(2) Adjust R9008 so that the voltage at P_2 and P_3 becomes 1V and -1V respectively.

6-3 DC Offset

Adjust R9040 so that the voltage at pin (1) and pin (4) of U9050 becomes the same.

6-4 GAIN Adjustment

It is recommendable to use an X-Y recorder for this adjustment. Set A sweep time/DIV to 1mS/DIV and B sweep time/DIV to 10 μ s/DIV. Apply a 6 DIV sine wave (1 kHz) and adjust R9063 so that the output signal becomes 0.6V _{p-p}.

6-5 Output DC level

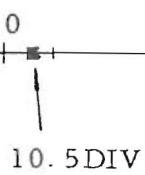

Set the trace to the center of horizontal graticule line and adjust R9055 so that the output level is 0 V.

Adjustment Procedure

6-6 Pen lift timing

Adjust R9195 so that the pen is lifted just when the brightened point reaches 10.5 DIV from the beginning of the sweep.

While pen is lifted, P_4 and P_5 are not closed.

6-7 Pen down timing

Adjust R9187 so that the pen comes down when the brightened point is at the starting of the A sweep.
